Experience

Eli Lilly and Company Aug 2025 – Present
Software Engineer *Remote*

- Designed a slot reservation service for radiopharmaceutical dose ordering used by **10K+ clinical technicians**, using idempotent requests and optimistic concurrency control to **eliminate double bookings across ∼5K bookings/day**.
- Built a patient context service for adverse event classification that retrieves live medical history and redacts PII before model input, **serving context in ∼3 ms across 8K+ cases/day**.
- Developed a citation verification component that checks model explanations against retrieved historical cases, helping **∼70% of adverse event cases (∼5.6K/day) bypass manual review**.
- Built Python transformers mapping **8K+ cases/day** to MuleSoft and Veeva formats; reviewed **∼20 PRs** for downstream stages.

Google Summer of Code May 2024 – Aug 2024
Software Engineer *Remote*

- Built and published **scorecode**, a Python package that retrieves OpenSSF Scorecard supply-chain security metrics; **adopted as a ScanCode.io dependency with ∼2K monthly PyPI downloads**.
- Integrated Scorecard results into ScanCode.io through reusable Django models, **adding supply-chain security scores to its CycloneDX SBOM exports**, with pytest coverage for public and private repositories.
- Iterated with maintainers through **code reviews**, refining API design, naming, documentation, and code quality.

Instoried Aug 2019 – May 2023
Software Developer (Founding Engineer) *Bengaluru, India*

- **Led a team of 5–6 engineers** delivering DevOps automation, monitoring, and authentication/authorization features; hired ∼5 engineers and drove technical design, code reviews, and mentoring alongside the CTO.
- Built the backend from scratch (Python, FastAPI, PostgreSQL) for an AI writing assistant recommending tone, emotion, and concision improvements, **scaling to 100K+ registered users and 30K+ daily actives**.
- Built an OAuth 2.0 service and developer portal letting **∼20 B2B customers** embed our recommendation APIs, **driving ∼20% of revenue**.
- Designed a Git-like text versioning system using snapshots and incremental deltas that sends only changed chunks on every save, **cutting payloads from up to ∼10 MB to a few KB** and letting any lost chunk be restored from the last snapshot.
- **Resolved serving failures under 3× campaign traffic spikes** by adding Redis caching (content-hashed keys, TTL, LFU eviction) and Kubernetes horizontal pod autoscaling, **cutting repeat recommendation latency from 1–2 s to ∼1 ms**.
- Built a real-time sales dashboard from scratch, fed by an incremental, checkpoint-based ETL pipeline that synced onboarding and campaign data **without adding load to the primary database**.

KaptureCRM Jan 2019 – May 2019
Software Developer *Bengaluru, India*

- Designed a bidirectional sync backend connecting Shopify, HubSpot, NetSuite, Snowflake, and SQL databases to the CRM through a canonical object model, so each source needed only its own mapper, **supporting 50+ onboarded clients**.
- Matched change capture to each source type (webhooks for SaaS platforms, WAL-based CDC for SQL databases, and offset-based polling workers for legacy systems), **propagating changes in both directions in near real time** with eventual consistency.

Aptus Data Labs Jun 2017 – Dec 2018
Software Developer *Bengaluru, India*

- Built **5 REST API connectors**, mostly sources such as QuickBooks and Zendesk, for an early-stage data migration platform that moved user-authorized data, limited to granted scopes, into destinations such as PostgreSQL.
- Contributed to a global data schema letting middleware read all sources uniformly, **replacing per-pair transformation logic**.
- Built Java-based Azure and JSON data-source plugins, **letting Yellowfin BI users visualize that data directly**.

Projects & Outside Experience

Compliance Checker | *Freelance, Novo Nordisk – Python, FastAPI, AWS Lambda, DynamoDB* Remote

- Designed and developed the complete backend that **automates compliance checks on clinical PDFs**: extracting information, checking it against client-defined rules, flagging violations, and applying corrections.
- Replaced an EC2-based PDF processing service with parallel AWS Lambda functions, splitting 400-page documents into 20–30 page tasks **processed in 6–10 seconds each**.
- Built a DynamoDB-backed pipeline to combine extraction results, with retries and dead-letter queues so **no failed task is lost**.

KYC Portal | *Freelance, Natixis Investments – Python, FastAPI, PostgreSQL, Kafka* Remote

- Designed and developed a KYC/AML screening platform that replaced spreadsheet-based workflows, **cutting screening and review turnaround from about one week to 8 hours**.
- Built a Kafka-based pipeline that collects financial data from Moody's, Refinitiv World-Check, and internal banking APIs in parallel, **combining results into one common format for analysts to review**.
- Implemented real-time screening updates using Server-Sent Events (SSE) and SSO-based access, **letting analysts track progress live**, review reports, add comments, and collaborate across teams.

Technical Skills

Languages: Python, C/C++, Java | **AI Tools**: Claude Code, Copilot
Frameworks & APIs: FastAPI, Flask, Django, Node.js, REST, gRPC, GraphQL, OpenAPI, Swagger, pytest
Cloud & DevOps: AWS (S3, Lambda), GCP (BigQuery), Docker, Kubernetes, Terraform, Jenkins, GitHub Actions, CI/CD, Git
Databases: PostgreSQL, Supabase, MySQL, MongoDB, Redis, Cassandra, Elasticsearch, DynamoDB
Architecture: Temporal, Apache Kafka, Microservices, Modular Monolith

Education

Purdue University, West Lafayette, IN | *Master of Science in Computer Science (Cyber Security)* | Jun 2023 – May 2025

Sambalpur University, Odisha, India | *Bachelor's in Computer Science* | Aug 2013 – Apr 2017
